

## FREQUENTLY ASKED QUESTIONS

### HOW DOES PASTELLE COMPARE TO OTHER TATTOO REMOVAL METHODS?

Most tattoo removal methods are harsh, painful and potentially scarring. They include surgical excision, dermabrasion (or sanding) and chemical peels. Pastelle treatments are not only safer, they are very precise, targeting only the ink used in the tattoo process. The most precise of all laser treatments is Q-Switched Laser.

### HOW MANY TREATMENTS WILL I NEED?

The size, location, depth and colour of your tattoo will determine how many treatments are required. Professional tattoo inks and light colours are more difficult to remove.

### HOW WILL THE TREATMENT FEEL?

The sensation of treatment is rather like the snap of a rubber band on the skin. Most patients do not require anaesthetics, although some people may feel more comfortable with a topical anaesthetic. Each session usually takes 10-30 minutes, depending on the size and colour composition of your tattoo.

### WHAT HAPPENS TO MY SKIN AFTER TREATMENT?

Right after your treatment, some whitening of the skin may occur, the area around the tattoo might become reddish and could have some swelling. This is normal and will disappear gradually over time. The full effect of each treatment takes about 5-6 weeks. Immediately after treatment, antibacterial ointment and gauze will be applied to the treated area to minimise the chance of infection.

For best ongoing results, you should always protect your skin from direct sun exposure. Always cover up and use a good SPF sunblock when out in the sun.

## PASTELLE

### HARD ON TATTOOS LIGHT ON SKIN

### Q-SWITCHED LASER FOR NO DOWNTIME TATTOO REMOVAL

- Targets darkened areas of pigmentation
- Breaks up areas of pigmentation, allowing the body to lighten and clear it naturally
- Surrounding tissue is not damaged
- Can treat light or dark skin types
- Fast and comfortable treatment
- Minimal downtime

# CLEAR AWAY TATTOOS

 pastelle

SAFE & EFFECTIVE  
TATTOO REMOVAL

0327V1

## RESTORE CLEAR SKIN

Pastelle targets and destroys the ink in tattoos so your body can eliminate it, leaving your skin clear again.

### STEP 1

Your practitioner may apply a numbing cream to your skin to ensure the treatment is as comfortable as possible. If the area has hair growth, the practitioner may shave it to avoid burning the hair.

### STEP 2

Pastelle precisely targets the ink particles in your skin with a beam of laser light. As the ink particles absorb the light from the laser, they are broken up into fragments.

### STEP 3

After treatment, the skin will be sensitive for a few days. It will be covered with a sterile non-adherent dressing to protect it. You must not scratch the area during the healing process. Your body will progressively remove the ink fragments.

### STEP 4

Your tattoo will require several treatments, depending on the colour and type of ink used. You need to allow 6 to 12 weeks between treatments to ensure your body has time to eliminate all the ink fragments.

*In some circumstances, Pastelle treatment might need to be postponed. You should seek medical advice if any of the following apply to you:*

- You have tanned skin
- You have a disease that is stimulated by light (e.g., Epilepsy)
- You are using photosensitive drugs (e.g., Roaccutane)
- You are pregnant or breastfeeding

## PASTELLE FADES TATTOOS

Before

When compared with other laser tattoo removal treatments, Pastelle Q-Switched Nd:YAG Laser tattoo removal provides

- outstanding results
- less risk of injury to the surrounding tissue
- more comfortable treatments
- quicker healing time

Regular lasers use a single wavelength of light to deliver the energy to the ink pigment in the skin. But the surrounding skin can also be damaged in the process.

## VISIBLE RESULTS

Six days after the second treatment

*\* Individual results may vary based on the aggressiveness of treatment, and the characteristics of the tattoo.*

The Pastelle Q-Switched Laser, delivers light energy in very short bursts in a choice of two wavelengths, so it precisely targets the cells containing pigment, with significantly less impact on the surrounding cells.

The number of treatments you need will depend on the age of the tattoo, the type and colour of the ink, and how the tattoo was originally applied. Light coloured inks such as light green and light blue are some of the most difficult to remove.
