# Reduce your size

 **SCIZER**

# Scientific Solution for Size Reduction

## What is SCIZER treatment?

The Scizer is a non-invasive body contouring procedure which simply means it will help you dispose of the stubborn fat around your waist with a method involving no cuts, stitches or incisions. The technology supporting this effective method is commonly referred to as HIFU or High Intensity Focused Ultrasound, it is based on the process called coagulative necrosis which melts and destroys the fat cells in the subcutaneous layer where the stubborn fat cells reside.

## Clinical Cases

## FAQ

### Does the Scizer treatment hurt?

Pain levels experienced by patients from different forms of HIFU treatment tend to vary, however with the contact cooling technology of the Scizer pain levels are substantially reduced due to the numbing effect the hand-piece provides on the treatment area. So the simple answer is NO, it does not hurt.

### How long does the treatment take?

The Scizer makes other treatments within the market seem unnecessary due to the fast treatment process with the simultaneous use of two applicators. An average treatment will take no longer than 20 minutes. Treatment lengths may vary based on the treatment area and what is comfortable for the patient.

### Who is a suitable candidate for Scizer treatment?

The Scizer treatment is recommended for all candidates who have stubborn fat in their abdominal region and are looking for other methods of treatment other than undergoing surgery which requires anesthesia and incisions. As long as you have a fat layer of more than 1 inch or 2.5 cm, you are suitable to receive Scizer treatment. Implants and other medical conditions may be an issue which your consultant will advise you at your assessment.

### Are there any side effects?

As the Scizer is applying ultrasound energy 13mm under the surface of the skin, melting the fat deposits in the subcutaneous fat layer at heat levels of 65°C, temporary redness, mild bruising, minimal discomfort and swelling may occur. All of these symptoms are resolved within a 1-2 days of receiving treatment.

## Treatment Principles

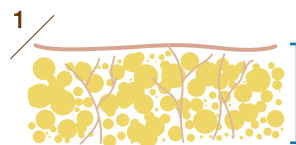

Time  
Efficient

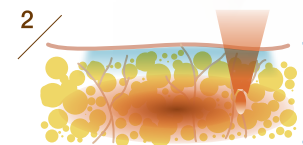

Anesthesia  
Free

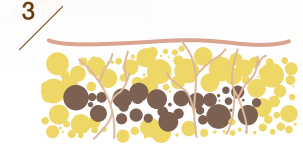

Enhanced  
Results

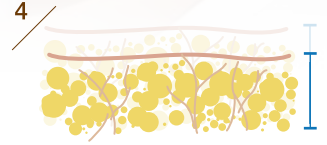

1/  
Even with a busy lifestyle and regular exercise, stubborn fat cells just don't seem to go away.

2/  
The theory behind the treatment is to target the stubborn fat cells that reside within the subcutaneous fat layer.

3/  
The manipulation of the adipocytes reduces the fat cell count in the targeted region.

4/  
The fat cells subside and naturally exit the body, reducing the localized fat deposits allowing you to feel brand new.
