

LOTUS GYNOLASER

Helping women feel
more comfortable
and confident

**VAGINAL REJUVENATION WITH THE LOTUS GYNOLASER
IS A SIMPLE, PREDICTABLE TREATMENT THAT CAN
SUCCESSFULLY TREAT THE SYMPTOMS OF VAGINAL
AGEING AND ATROPHY.**

Women's sexual health is emerging as one of the fastest-growing areas of wellness. Indeed, around half of all women will suffer symptoms of vaginal relaxation syndrome, vaginal ageing and urinary incontinence, which can include diminished sensation during intercourse, dryness, pain or discomfort, laxity, and urinary incontinence and urgency.

The topic of women's sexual health and function is becoming more openly discussed and there is high demand for non-surgical low-risk/high-reward in-clinic procedures. LOTUS GynoLaser, distributed by Cryomed, is the latest state-of-the-art treatment using CO₂ laser technology to tighten and strengthen vaginal tissues and is one of the only systems in the market registered in the ARTG.

LOTUS GynoLaser is simple to perform, fast and with no downtime,

improving the symptoms of vaginal relaxation syndrome, vaginal ageing and urinary incontinence and providing renewed, healthy vaginal tissue after just one treatment.

A next generation treatment

The LOTUS system features a range of technological advancements that sets it apart in the marketplace.

The breakthrough treatment incorporates innovative features designed to maximise patient comfort and clinical efficacy. The LOTUS Probe is only 19mm, with a 90-degree reflecting gold-coated mirror and 8mm round MicroZone optic, providing the ability to rotate 45 degrees at a time, ensuring more extensive coverage of the vaginal wall than previous technologies.

It is also equipped with the i-Slide, a patented comfort slide that hovers over the treatment probe

for greater ease of operation and rotation, ensuring maximum control and patient comfort.

LOTUS GynoLaser treatment stimulates the mucosal tissue of the vagina, and promotes neocollagenesis, enriching the mucous membrane with new, more tensile and elastic collagen. It also helps restore the natural pH of the vaginal mucosa and increases blood circulation.

Flexibility, strength and moisture content are all improved, resulting in a tighter and better-lubricated vaginal wall. This also has a positive effect on the ability of the pelvic muscles to perform their role in bladder control.

The LOTUS handpiece is used with the renowned Fraxis Duo system, which has numerous applications for face and body treatments. The Fraxis platform offers any combination of fractional CO₂ laser and microneedle fractional RF, for treatment of a large range of medical and cosmetic indications.

The LOTUS procedure

The treatment protocol is simple, results are reproducible and it can easily be incorporated into a practice. While other treatments may be randomised, LOTUS GynoLaser has a very replicable protocol.

The laser probe is inserted into the vagina and applied to the mucosal tissue of the vagina, delivering fractional laser light in micro pulses. The pulsing energy contributes to the treatment's safety profile, and the wavelength is optimum for collagen regeneration.

With just one 10-15 minute procedure, LOTUS GynoLaser can improve sensation during intercourse, restore natural lubrication to the vagina, reduce

vaginal pain or discomfort, tighten the vagina and reduce urinary incontinence and urgency.

Patients are able to return to their normal activities straight after treatment. Results can be felt almost immediately, with further improvements for up to a month after treatment. Generally patients will require a series of three treatments, spaced about six weeks apart to achieve full results.

LOTUS GynoLaser is one of the most powerful and efficient laser technologies for the treatment of vaginal atrophy and vaginal relaxation syndrome. It can enable suitable patients to lead a more confident, comfortable and care-free life, as well as opening up a whole new subset of patients to your practice.

LOTUS GynoLaser is helping women lead more comfortable and confident lives, and clinics introducing vaginal rejuvenation into their practice will be delivering a solution to an under-served women's health and wellness need. **AMP**

LOTUS GynoLaser Highlights

- Quality clinical information
- FRAXIS and FRAXIS DUO registered in the ARTG for stress urinary incontinence and vaginal relaxation syndrome (ARTG 273658)
- i-Slide registered in the ARTG for gynecological applications (ARTG 289656)
- LOTUS Probes registered in the ARTG for the application of surgical laser therapy (289657)
